| Internal excess of migration | 2025 | total | -1863 | -293 | 187 | -381 | -1125 | -241 | -17 | 11 | -10 | 10 | 2 | 0 |
| | | men | -1175 | -153 | 96 | -237 | -692 | -169 | -17 | 11 | -9 | 2 | 3 | 0 |
| | | women | -689 | -138 | 93 | -147 | -437 | -75 | -1 | 6 | -1 | 7 | 7 | 0 |

From the reference year 2025 onwards, a small controlled random uncertainty is introduced in all reported data. The uncertainty has been added to protect individuals so that no one risks being exposed in the statistics. As a result, the reported totals are not always equal to the sum of their reported components.

If reported statistical values are added together to create a new total, the uncertainty is also added. There is therefore a risk that the new total contains greater uncertainty than that which – under the method – would have been added to a single value.

The method used for disclosure control is called Cell Key Method (CKM). You can read more about the method here: [Protection methods for disclosure control](https://www.scb.se/en/documentation/statistical-methods/protection-methods-for-disclosure-control/) and here: [Development of disclosure protection](https://www.scb.se/en/documentation/statistical-areas-under-change/development-of-disclosure-protection/).

When calculating age-specific rates per 1 000 of the mean population, the mean population for the year of birth should be used

age: Age refers to age attained by the end of the year, i.e. in principal, an account for the year of birth.

Immigrations: Migration cannot be added with regard to regions. When, for instance, municipalities are added to metropolitan areas, migration to the region is added to migrations within the region.

Outmigrations: Migration cannot be added with regard to regions. When, for instance, municipalities are added to metropolitan areas, migration from the region is added to migrations within the region.

Excess of migration: Excess of migration is the difference between the number of immigration and outmigration.

Excess of Immigration: Excess of immigration is the difference between the number of immigration from abroad (immigrants) and outmigration to abroad (emigrants).

Internal Immigrations: Migration cannot be added with regard to regions. When, for instance, municipalities are added to metropolitan areas, migration to the region is added to migrations within the region.

Internal Immigrations: Internal immigrated means immigrated less immigrants.

Internal Outmigrations: Migration cannot be added with regard to regions. When, for instance, municipalities are added to metropolitan areas, migration from the region is added to migrations within the region.

Internal Outmigrations: Internal outmigrated means outmigrated less emigrants.
